Wet Sandblaster is stamped with a European safety pressure. Use only at above specifications to assure proper wet sandblaster life and performance.

SELECTION: Select the sandblaster model by orifice size to match your system flow and pressure. The special Sand Induction Hose Assembly should be used to prevent collapsing during operation. For optimum performance the **sand inlet hose should not exceed the 25 feet included in the assembly.**

INSTALLATION: For best results the sand unit should be connected to a quality high pressure water source. A pressure gauge should be installed on the system to

monitor system pressure as performance of the sandblaster is directly affected by the pressure of the system. A regulator or unloader must be installed in the pump discharge line of any system with a shut-off gun to handle by-pass liquid when the gun is shut off. Connect one end of the sand intake hose to sand siphon probe, place probe into sand supply and attach the other end to the hose connection tube at the body. Connect the sandblaster body to any 1/4" lance with 3500 PSI rating.

⚠ WARNING

Severe injury can occur with high pressure spray.
Do not allow spray to contact any part of body.

WARRANTY

90 Day Warranty

Refer to complete CAT PUMPS Warranty for further information.

OPERATION: Start the high pressure system. Open trigger on gun to assure system is operating properly. When the sand unit is operating efficiently, there will be a smooth and continuous flow of sand through the nozzle. The pressure and flow rate through the spray nozzle are the factors that determine the rate of sand flow. See **Performance Chart**. If the spray nozzle is chosen to give the maximum pressure and flow rate possible for the pump, the rate of sand flow will also be at maximum. Keep sand supply dry for best performance.

CAUTION

Adequate safety equipment and clothing must be worn during operation of the wet sandblaster.

TROUBLESHOOTING

No Sand:

- Plugged sand probe
- Clear obstruction in sand probe.
- Wet sand
- Remove mixing nozzle and inspect mixing chamber.
- Low vacuum
- Dry or replace sand.
- Check for air leak in system.

Not enough sand:

- Low water pressure
- Check water supply to pump, nozzle size and RPM of pump.
- Collapsed hose
- Use reinforced hose. Remove any obstruction.
- Hot water reduces efficiency
- Optimum performance obtained with cold water.
- Partially plugged sand probe
- Remove any restriction from sand probe inlet. Use dry sand.
- Restricted sand flow
- Increase diameter of hose. Recommend 1/2" ID, Maximum 25 ft.
